### Synopsis

The native fish community of Gull Lake was probably dominated by perch and bullheads. Smallmouth bass were stocked as early as 1905, suggesting they were not native. Several other species were stocked up until the 1950's with little success. Bass are now the dominant sport fish species in the lake. Rainbow trout are stocked in an attempt to diversify the fishery in this easily accessible, near-urban lake. Although the amount of suitable cold water habitat is quite limited, the trout stocking is currently very successful. We speculate that trout move between Gull and Silver Lake, taking advantage of the deeper water afforded by Silver Lake.
